----------------------

Signature

**Note:**

- Cross your immatriculation number in the crossboxes. It will be evaluated automatically.
- Sign in the signature field.
- Allowed tools are only a pocket calculator and an analog dictionary English  $\leftrightarrow$  native language without notes.
- Potentially helpful formulas from the cheat sheet are printed at the backside.
- Do not write with red or green colors nor use pencils.

This quiz contains multiple choice/multiple answer sub-tasks, i.e. at least one answer option is correct in each case. These sub-tasks are scored with 1 point per correct answer and  $-1$  point per incorrect answer. Missing answers have no effect. The minimum score per sub-task is 0 points.

a)\* Which steps in the message transmission add redundancy to the message?

- |                                       |   |  |   |
|---------------------------------------|---|--|---|
| <input type="checkbox"/> Souce coding | <input type="checkbox"/> Channel decoding | <input type="checkbox"/> Source decoding | <input type="checkbox"/> Channel coding |
| <input type="checkbox"/> Demodulation | <input type="checkbox"/> Modulation       | <input type="checkbox"/> Detection       | <input type="checkbox"/> Line coding    |

b)\* What are equivalent values for the size of a 420 000 B large file?

- |                                    |  |                                   |                                  |  |                                  |
|------------------------------------|--|-----------------------------------|----------------------------------|--|----------------------------------|
| <input type="checkbox"/> 3360 Mbit | <input type="checkbox"/> $\sim 410.16$ KiB | <input type="checkbox"/> 420 kbit | <input type="checkbox"/> 0.42 MB | <input type="checkbox"/> $\sim 430.33$ KiB | <input type="checkbox"/> 3360 kB |
|------------------------------------|--|-----------------------------------|----------------------------------|--|----------------------------------|

c)\* What is the approximate SNR when sending a signal with a power of 17 mW and a noise power of 260  $\mu$ W is measured?

- |  |  |  |   |                                       |                                      |
|--|--|--|---|---------------------------------------|--------------------------------------|
| <input type="checkbox"/> $\sim 16.85$ dB | <input type="checkbox"/> $\sim 18.15$ dB | <input type="checkbox"/> $\sim 46.45$ dB | <input type="checkbox"/> $\sim 2.82$ dB | <input type="checkbox"/> $\sim 65.38$ | <input type="checkbox"/> $\sim 0.15$ |
|--|--|--|---|---------------------------------------|--------------------------------------|

d)\* What is the smallest achievable step size when quantizing the interval  $I_Q = [45; 160]$  with 6 bit codewords?

- |                                      |                             |                                      |                                      |                                      |  |
|--------------------------------------|-----------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--|
| <input type="checkbox"/> $\sim 0.70$ | <input type="checkbox"/> 64 | <input type="checkbox"/> $\sim 0.18$ | <input type="checkbox"/> $\sim 0.90$ | <input type="checkbox"/> $\sim 1.80$ | <input type="checkbox"/> $\sim 109.86$ |
|--------------------------------------|-----------------------------|--------------------------------------|--------------------------------------|--------------------------------------|--|

e)\* What is the quantization error for the read value 9 when the quantization levels are  $Q = \{0.5, 1.5, 2.5, 3.5\}$ ?

- |                              |                              |                              |                            |                              |                              |
|------------------------------|------------------------------|------------------------------|----------------------------|------------------------------|------------------------------|
| <input type="checkbox"/> 6.5 | <input type="checkbox"/> 5.5 | <input type="checkbox"/> 4.5 | <input type="checkbox"/> 9 | <input type="checkbox"/> 0.5 | <input type="checkbox"/> 7.5 |
|------------------------------|------------------------------|------------------------------|----------------------------|------------------------------|------------------------------|

f)\* A message source  $Q$ , emits characters independently and uniformly from the alphabet  $\mathcal{A} = \{\pi, \epsilon\}$ . What is the information content of the character  $\pi$ , rounded to two decimals?

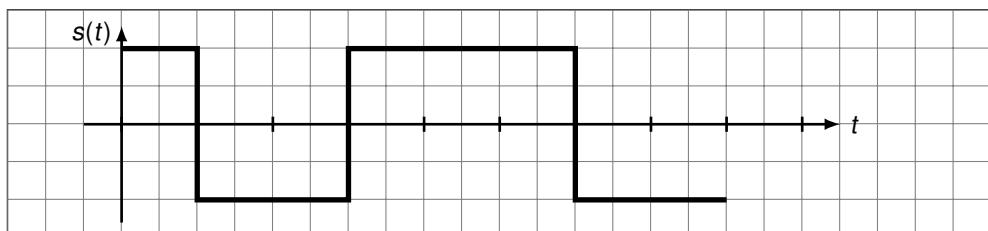

- |                               |                               |                               |                               |                               |                               |
|-------------------------------|-------------------------------|-------------------------------|-------------------------------|-------------------------------|-------------------------------|
| <input type="checkbox"/> 2.71 | <input type="checkbox"/> 0.50 | <input type="checkbox"/> 0.00 | <input type="checkbox"/> 5.75 | <input type="checkbox"/> 1.00 | <input type="checkbox"/> 3.14 |
|-------------------------------|-------------------------------|-------------------------------|-------------------------------|-------------------------------|-------------------------------|

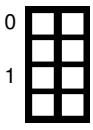

g)\* What factor **does not** affect the theoretical capacity of a channel?

- |  |  |  |  |
|--|--|--|--|
| <input type="checkbox"/> Propagation delay | <input type="checkbox"/> Channel bandwidth | <input type="checkbox"/> Number of symbols | <input type="checkbox"/> Signal-to-noise ratio |
|--|--|--|--|

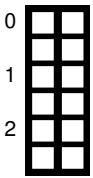

h)\* Given is the baseband signal shown below, which encodes the bit sequence 1001 1100. Which line code was used to encode the signal?

- |                                     |
|-------------------------------------|
| <input type="checkbox"/> MLT-3      |
| <input type="checkbox"/> Manchester |
| <input type="checkbox"/> RZ         |
| <input type="checkbox"/> NRZ        |
| <input type="checkbox"/> PAM-4      |

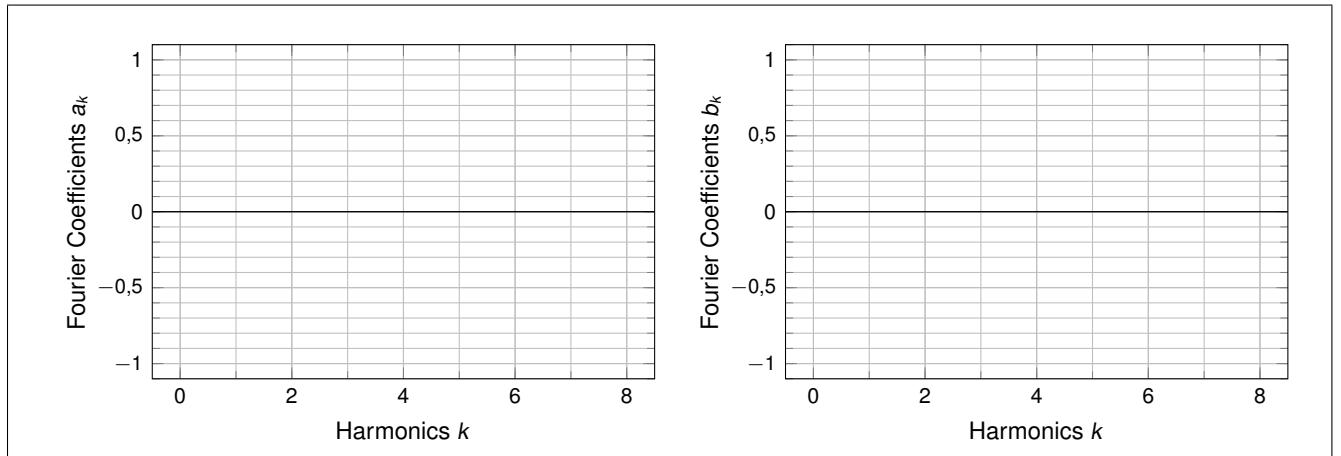

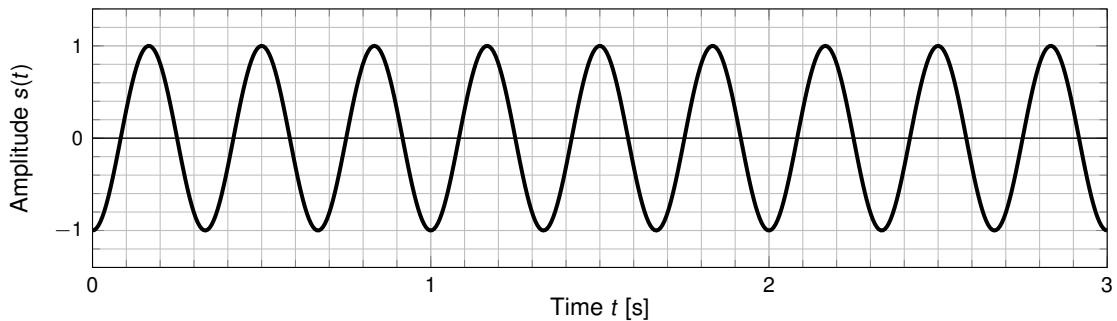

i)\* Argue with an example why clock recovery cannot be done reliably on a signal encoded with the MLT-3 line code.

j)\* Given is the periodic time signal  $s(t)$  shown below. The period of the signal is  $T = 1$  s and the angular frequency the standard  $\omega = \frac{2\pi}{T}$ . Draw the spectrum of the time signal  $s(t)$  in the solution box and include zero values.

**Information content and entropy:** Memoryless source emits characters  $x \in \mathcal{X}$ , expressed by random variable  $X$ :

$$\text{Information content of } x \in \mathcal{X}: \quad I(x) = -\log_2(\Pr[X = x])$$

$$\text{Entropy of the source:} \quad H(X) = -\sum_{x \in \mathcal{X}} \Pr[X = x] \log_2(\Pr[X = x])$$

**Fourier series:** angular frequency  $\omega = 2\pi/T$

$$s(t) = \frac{a_0}{2} + \sum_{k=1}^{\infty} a_k \cos(k\omega t) + b_k \sin(k\omega t) \quad \text{where}$$

$$a_k = \frac{2}{T} \int_{-T/2}^{T/2} s(t) \cos(k\omega t) dt, \quad b_k = \frac{2}{T} \int_{-T/2}^{T/2} s(t) \sin(k\omega t) dt.$$

**Sampling, Quantization and Reconstruction:**

$$\text{Sampling theorem (Nyquist):} \quad f_N = 2B \quad (B \text{ is single-sided cutoff frequency in baseband})$$

$$\text{Step width:} \quad \Delta = \frac{b-a}{M}, \quad \text{with } M = 2^N \text{ steps at } N \text{ bit accuracy}$$

$$\text{Quantization levels:} \quad Q = \{a + \Delta/2, a + \Delta(1+1/2), \dots, a + \Delta(M-1+1/2)\}$$

$$\mathbb{R} \rightarrow Q, \quad \tilde{s}[n] \mapsto \bar{s}[n] \quad (\text{rounded})$$

$$\text{Quantization error:} \quad q_s(t) = s(t) - \bar{s}(t) \leq \Delta/2, \quad \text{if } a \leq s(t) \leq b$$

**Channel bandwidth:**  $C_{\max}$  is an upper bound for the achievable net data rate in bit/s, i.e. transmission of redundancy-free data. For this purpose it may be necessary to add redundancy (channel coding), but this does not change the information content of the message.

$$\text{Hartley:} \quad C_H = 2B \log_2(M) \text{ bit}$$

$$\text{Shannon/Hartley:} \quad C_S = B \log_2(1 + \text{SNR}) \text{ bit}$$

$$\text{Signal-to-noise ratio:} \quad \text{SNR} = \frac{P_S}{P_N} = \frac{\text{signal power}}{\text{noise power}} = 10^{\frac{\text{SNR}}{10 \text{ dB}}} = 10 \log_{10}(\text{SNR}) \text{ dB}$$

$$\text{Upper bound:} \quad C_{\max} \leq \min \{C_H, C_S\}$$

**Channel coding:** Example - Block codes: Blocks with length  $k$  bit are mapped to channel words with length  $n$  bit where  $n > k$ . Depending on the code, it is possible to correct  $m < n - k$  bit errors per channel word.

$$\text{Code rate: } R = k/n$$

**Serialization time, Propagation delay, Transmission time, Bandwidth delay product:**

$$\text{Serialization time:} \quad t_s = L/r$$

$$\text{Propagation delay:} \quad t_p = d/(v c_0)$$

$$\text{Transmission time:} \quad t_d = t_s + t_p$$

$$\text{Bandwidth delay product:} \quad C = t_p r$$
